## In the Claims

1. (Currently amended) A method permitting compact ways to update fuzzy relationships between entities in an audiovideo sequence, or serial set of sequences, the method comprising:

writing a description <u>scheme</u> containing relations corresponding to relationships between the entities in the audiovideo sequence;

determining the relations for representation by parameters to define the fuzzy relationships, each parameter having numerical values representing confidence in the corresponding fuzzy relationship; and

obtaining from the user, one or more at least one of the following:

- (a) a numerical value for each parameter[[;]],
- (b) a description of the parameter containing a numerical value[[;]], and
- (e) a description capable of setting the parameter dynamically; and

modifying the numerical values representing the confidence in response to changes in the parameter as the multimedia sequence progresses.

2. (Currently amended) The method of claim 1 further comprising:
combining an MPEG7 State DS (description scheme) with an additional field in
an MPEG7 GraphType DS.

- 3. (Cancelled)
- 4. (Currently amended) The method of claim 1 further comprising: running, by a user, a query based on membership of an entity in one of the relations.
- 5. (Currently amended) A computer-readable medium having executable instructions to cause a computer to perform a method comprising:

writing a description <u>scheme</u> containing relations corresponding to relationships between entities in an audio visual sequence;

determining the relations for representation by parameters to define fuzzy relationships, each parameter having numerical values representing confidence in the corresponding fuzzy relationship; and

obtaining for each parameter at least one of

- a numerical value,
- a description of the parameter containing a numerical value, and
- a description capable of setting the parameter dynamically; and

modifying the numerical values representing the confidence in response to changes in the parameter as the multimedia sequence progresses.

6. (Previously amended) The computer-readable medium of claim 5, wherein the method further comprises:

combining an MPEG7 State DS (description scheme) with an additional field in an MPEG7 GraphType DS.

- 7. (Cancelled)
- 8. (Previously amended) The computer-readable medium of claim 5, wherein the method further comprises:

performing a query based on membership of an entity in one of the relations.

9. (Currently amended) A method of weighting a fuzzy relation between description schemes in a content description for a multimedia sequence comprising:

deriving a confidence value for the fuzzy relation from a parameter associated with one of the description schemes, the confidence value representing a degree to which the fuzzy relation is a member of a subset of relations among the description schemes; and

modifying the confidence value in response to changes in the parameter as the multimedia sequence progresses.

- 10. (Previously presented) The method of claim 9, wherein the parameter is an attribute value.
- 11. (Previously amended) The method of claim 9, wherein the confidence value is further derived from a set of parameters associated with the description schemes.

## 12. (Cancelled)

- 13. (Previously presented) The method of claim 9, wherein the description schemes represent entities in the multimedia sequence, the fuzzy relation represents a relationship between the entities, and the confidence value represents a state of the relationship.
- 14. (Previously presented) The method of claim 13, wherein the state of the relationship is described by a state description scheme that specifies the parameter.
- 15. (Previously presented) The method of claim 9 further comprising:

associating the description schemes with a set of vertices in a graph and the subset of relations with a set of edges among the set of vertices; and

calculating the confidence value of the fuzzy relation using a membership function based on graph mapping.

- 16. (Previously presented) The method of claim 15, wherein the membership function is  $m_R(x) = g \circ f(x)$ , where R is the set of edges over the set of vertices A x B, g defines a function for the parameter over a parameter space PS, and f is a parameterization function  $f: A \times B \rightarrow PS, g: PS$ .
- 17. (Previously presented) The method of claim 15 further comprising:

writing the graph without the edge representing the fuzzy relation if the confidence value is zero.

18. (Previously amended) A computer-readable medium having executable instruction to cause a computer to perform a method comprising:

deriving a confidence value for a fuzzy relation between description schemes from a parameter associated with one of the description schemes, the confidence value representing a degree to which the fuzzy relation is a member of a subset of relations among the description schemes in a content description for a multimedia sequence; and

modifying the confidence value in response to changes in the parameter as the multimedia sequence progresses.

- 19. (Previously presented) The computer-readable medium of claim 18, wherein the parameter is an attribute value.
- 20. (Currently amended) The computer-readable medium of claim 18, wherein the confidence value is further derived from a set of parameters associated with the description schemes.
- 21. (Cancelled)
- 22. (Currently amended) The computer-readable medium of claim 18, wherein the description schemes represent entities in the multimedia sequence, the fuzzy relation represents a relationship between the entities, and the confidence value represents a state of the relationship.
- 23. (Previously presented) The computer-readable medium of claim 22, wherein the state of the relationship is described by a state description scheme that specifies the parameter.
- 24. (Previously presented) The computer-readable medium of claim 18, wherein the method further comprises:

associating the description schemes with a set of vertices in a graph and the subset of relations with a set of edges among the set of vertices; and

calculating the confidence value of the fuzzy relation using a membership function based on graph mapping.

- 25. (Previously presented) The computer-readable medium of claim 24, wherein the membership function is  $m_R(x) = g \circ f(x)$ , where R is the set of edges over the set of vertices  $A \times B$ , g defines a function for the parameter over a parameter space PS, and f is a parameterization function  $f: A \times B \rightarrow PS$ , g: PS.
- 26. (Previously presented) The computer-readable medium of claim 24, wherein the method further comprises:

writing the graph without the edge representing the fuzzy relation if the confidence value is zero.
